

## Developments and Dangers

Weekly Report 9/10/18 - 9/16/18

Throughout the week, a recurring factor became low scoring grades on the research assessments, even after editing them, they just were not making the cut. Thursday was the day that it all truly came together and has blossomed to a full future of opportunities. While discovering the correct way to analyze and also a new way to analyze all information for any subject matter by asking a few simple questions, why does this matter? Who does this help? How could I apply it to the future? Will this information set me apart from others? These new techniques have granted the ability to move forward within the class and will continue to grow in comprehension as more difficult and controversial topics arise. In the meantime however, simpler topics to grasp such as how scar tissue affects the body were able to be retained to memory as the previous questions evoked thought and demanded careful annotations and true understanding of what was being written, rather than simple summary with the few quotes embedded into the assessment. These improvements of writing skills will help further once interviews and mentor visits are conducted as there will be no article to look back on and no way re-experience a particular visit. Instead the resources which will be used at home and school will be the notes taken during said visits, these notes will be the equivalent to annotations and will require a higher-level of thinking to conduct an assessment.
